inputs prompt

GPT

What structure method is to be used from SRP combinations.csv, Restates problem in Natural language words (no verbatim retelling of prompt), clarification of ambiguous terms, identification of core problem to be answered, Problem restatement: Structure informed Decomposition of problem Ontology questions: identification of key entities (what things matter), define relationship between entities, Question Mapping: looking at hierarchies, dependencies, interactions of prompt question, Document: Why these entities matter for prompt given structure. Boundary setting: what is in-scope What is the analysis going to cover, What is out of scope What are we explicitly excluding? Why can we confidently state these boundaries are appropriate. What assumptions must be true at the boundary & what assumptions were made. Constraint identification: Time constraints: what are the deadlines, Windows, urgency if any, are there what are the Budgetary constraints: Resources, Costs, economic limits. What are the Technical constraints: what are required capabilities, infrastructure, how feasible is it. Are there legal constraints (within reason): are there any Regulatory constraints, what are the compliance and liability concerns. What are the Ethical constraints: what are the Values , what are the stakeholders impacts, what is fair (reduction of exploitation/harm to immediate stakeholders and outside stakeholders). Documentation: Specific numbers/thresholds where known. Assumption specification: list out what must be true for analysis to hold, what Justifies Why these assumptions are reasonable. Risk what happens if assumptions are violated or wrong. Flag which assumptions are most uncertain. Level of detail consideration: what will Determine: appropriate granularity for this problem. What justifies why this level (not more/ less detail). There must be a Balance: between Completeness VS Traceability. Structure and Decompositions complete Ask any clarifying questions now

Response

GPT

use the Reasoning method from the SRP combinations .CSV. that was selected and develop 2 internal rival hypotheses/approaches. Ensure: rivals are genuinely distinct (Not cosmetic).

Frame each rival as testable claim and use same Structure method. Document: Clearly state each rivals claim. What are the Constraints for the three total individual rivals A, B and C, external rivals must differ in mechanism (not just conclusion)for the three hypotheses/approach, Identity: What kinds of evidence would support them, of all rival types Identity: what kinds of evidence would support them evidence that contradict this them, Prioritize: which evidence most discriminating. Plan out tool calls needed to gather evidence.

Tool

Save important memory/scratchpad then Select appropriate tools eg web search for current info, web-fetch specific URL , calculator of math, memory read.

GPT

Evaluate tool gathered information Assess: the Authority: who is its source, Recency: when published, Methodology: how was data collected? Biased conflict of interest? Confidence score 1 to 5 with justification

Do follow up tool calls needed to be made

Tool

Save collected information in memory/scratch pad

GPT

For each piece of evidence, Extract: specific claim, Quote: relevant excerpt if appropriate Attribute: full provenance, source, URL timestamp. Confidence score, and tag (which rival it is for)

Tool

Save to memory/scratch pad

GPT

Rival A

Supporting evidence list all evidence favoring this rival assess quality and relevance, list all contradicting evidence for this rival assess Quality and relevance weight by confidence and source quality

Tool

Save to memory/scratch pad

Gpt

Rival B

Supporting evidence list all evidence favoring this rival assess quality and relevance, list all contradicting evidence for this rival assess Quality and relevance weight by confidence and source quality

Tool

Save to memory/scratch pad

GPT

Rival C

Supporting evidence list all evidence favoring this rival assess quality and relevance, list all contradicting evidence for this rival assess Quality and relevance weight by confidence and source quality

Tool

Save to memory/scratch pad

GPT

Testing rivals Design: Test what would distinguish Rivals, Specify testable prediction, Ensure test is falsifiable, Document: How to execute test? Specify: what outcome supports which rival

Tool

Save to memory/Scratchpad

GPT

Kill Step specification

Rival A

Indicator: what specific metric/signal to monitor, Threshold: numeric or qualitative trigger point, Action: what to do if threshold crossed, Owner: who is responsible for monitoring/action, Time frame when to check indicator

Tool

Save to memory/Scratchpad

GPT

Kill Step specification

Rival B

Indicator: what specific metric/signal to monitor, Threshold: numeric or qualitative trigger point, Action: what to do if threshold crossed, Owner: who is responsible for monitoring/action, Time frame when to check indicator

Tool

Save to memory/Scratchpad

GPT

Kill Step specification

Rival C

Indicator: what specific metric/signal to monitor, Threshold: numeric or qualitative trigger point, Action: what to do if threshold crossed, Owner: who is responsible for monitoring/action, Time frame when to check indicator

Tool

Save to memory/Scratchpad

GPT

Apply chosen Reasoning method to all information collected reference CVS file synthesize evidence across Rivals reason about which rival best explains evidence

Tool

Save to memory/Scratchpad

GPT

Select rival: with strongest support, Justify: why this rival wins explicit reasoning, Quantify confidence in winner based on evidence, Acknowledge: the winners Rivals and there limitations and uncertainties, Document: what evidence could change conclusion

Tool

Save to memory/Scratchpad

GPT

I need to retrieve memory

Tool

Supplies memory

GPT

Information for long term memory with Key: descriptive identifiers, Value: knowledge to store, Provenance: source Trace + Evidence, Confidence: score value score reuse potential with justification, expiry duration plus tags for retrieval hooks

Tool

Save to long term memory

GPT

What Presentation method will be used based on the Structure & Reasoning methods chosen. Format selection and application apply presentation method formatting This requires memory retrieval

Tool

retrieve memory

GPT

Next Content organization

Structure: Review and Retrieve information about the Structure and Reasoning outputs and create use it to fill in/complete the presentation method requirements, Hierarchy. Section headings priority ordering, Flow: Logical progression of ideas, Emphasis highlight key findings per format conversation, Citation linking: every claim linked to scratchpad evidence, Use: evidence ID or similar reference Format etc. Enable: user to trace claim to source, Verify: no one supported claims, confidence statement, State: numeric confidence 0 to 100% justify why this confidence level, Bounds range or conditions, Basis link to evidence, quality and rival evaluation, Must provide Actionable concrete actions, not vague suggestions, that are Prioritized: Order by importance/urgency, making sure everything is Assigned: Who should do what (if known), any type of Timed: Deadlines or sequencing, Conditional: "If X, then do Y; if Z, then do W" are important to remember
